

CONSTRUCTION

Workers in the construction industry may work across many sites. To do this effectively, a flexible and reliable IT system is essential. This can ensure the organisation is efficient and agile.

Fibre broadband enables construction company employees to work remotely, on or off site. Documents can be transferred easily without having to travel to a main office, reducing travel time and costs and improving the firm's carbon footprint.

Superfast transfers

Fibre upload speeds mean that employees can transfer large amounts of data to clients or colleagues anywhere in the world just as rapidly as if they were in the office next door, potentially saving time and money by reducing the number of site visits.

Productive people

Fibre broadband to the home enables staff to work remotely, rather than commuting to an office. Flexible working reduces travel costs and the environmental impact of a business, as well as enabling staff to be productive while maintaining a healthy work-life balance.

Clever communication

Business meetings can be conducted in the most convenient locations for all the participants, using video conferencing and collaboration tools.

Efficient projects

Time is money on construction projects; fibre broadband enables staff to work productively and flexibly from wherever they are located, reducing the likelihood of communication or information technology causing delays.
